Note of Appreciation

Canada owes the success of its statistical system to a long-standing cooperation involving Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

The cooperation of provincial and territorial Vital Statistics registries who supply the mortality data in this report to Statistics Canada is gratefully acknowledged.

How to obtain information

Orders or inquiries about this product and related statistics or services should be directed to: Client Custom Services Unit, Health Statistics Division, Statistics Canada, Ottawa, Ontario, K1A 0T6 (telephone 1-613-951-1746)

Note de reconnaissance

Le succès du système statistique du Canada repose sur un partenariat bien établi entre Statistique Canada et la population, les entreprises, les administrations canadiennes et les autres organismes. Sans cette collaboration et cette bonne volonté, il serait impossible de produire des statistiques précises et actuelles.

Statistique Canada tient à manifester sa gratitude envers les provinces et territoires qui nous ont fourni de leurs registres des statistiques de l'état civil, les données sur la mortalité qui apparaissent dans ce rapport.

Comment obtenir d'autres renseignements

Toute commande ou demande de renseignements au sujet du présent produit ou au sujet de statistiques ou de services connexes doit être adressée à : Services à la clientèle personnalisés, Division des statistiques sur la santé, Statistique Canada, Ottawa, Ontario K1A 0T6 (téléphone : 1-613-951-1746).

INTRODUCTION

History

The collection of vital statistics began in Canada, as in France and England, with the registration by the ecclesiastical authorities of baptisms, marriages and burials. These registers have made it possible to compile vital statistics for Quebec since 1610.

For Canada as a whole, it was impossible to compile a satisfactory series of vital statistics prior to 1921. Obstacles to such a national compilation included variations in the vital statistics legislation among provinces, incompleteness of registration, lack of uniformity in classification and method of presentation, omission of important data and choice of fiscal instead of calendar year as the time unit.

In 1918, the Dominion Bureau of Statistics (DBS, now Statistics Canada) was established by the Statistics Act. Two Dominion-Provincial Conferences held in the same year established the mechanism for the DBS and the provincial Vital Statistics Offices to produce national vital statistics. In this cooperative scheme, DBS would supply the standard registration forms for births, stillbirths, deaths and marriages to the provinces, who would return transcripts of the completed forms to DBS. Eight provinces initially entered into the cooperative system, leading to publication of the first annual report for Canada in 1921. Quebec entered in 1926, and Newfoundland in 1949. Data from the territories were first included in the regular publications in 1950.

Purposes

Now, as in the early years, the complete and accurate registration of all "vital" events in Canada is the main objective of this collaborative effort among the provinces, the territories and Statistics Canada. Under a federal-provincial agreement, the registration of births, stillbirths, deaths and marriages is the responsibility of the provinces and territories. The primary function of the provincial and territorial registration systems is to obtain and preserve such documentary evidence as is necessary to protect the legal rights of the individual. At any time after registration, the individual or family concerned may refer to the records for proof of the pertinent facts concerning a birth, stillbirth, death or marriage.

While the production of statistics is of secondary importance to the provincial and territorial registries of vital statistics, the data are used extensively by the research community and other health professionals. At the national level, the primary use of the data is statistical, such as in

INTRODUCTION

Historique

Au Canada, comme en France et en Angleterre, les premières données sur l'état civil ont été recueillies par les autorités ecclésiastiques, qui enregistraient les baptêmes, les mariages et les enterrements. Ces registres ont permis de compiler des statistiques de l'état civil pour le Québec depuis 1610.

Pour le Canada tout entier, il n'a pas été possible de compiler une série satisfaisante de statistiques de l'état civil avant 1921. Parmi les obstacles qui ont nui à la compilation de ce genre de statistiques à l'échelle nationale, mentionnons les différences entre les lois provinciales à cet égard, les lacunes dans l'enregistrement, le manque d'uniformité dans la classification ou dans la méthode de présentation, l'omission de données importantes et le choix de l'année financière au lieu de l'année de calendrier comme unité de temps.

En 1918, le Bureau fédéral de la statistique (BFS, maintenant Statistique Canada) était créé en vertu de la Loi sur la statistique. C'est au cours de deux conférences fédérales-provinciales tenues cette même année que le BFS et les bureaux provinciaux de l'état civil ont conclu une entente de collaboration en vue de produire des données nationales sur l'état civil. Selon cette entente de collaboration, le BFS devait fournir les formulaires d'enregistrement normalisés pour les naissances, les mortinaissances, les décès et les mariages aux provinces qui devaient lui renvoyer des copies des formulaires remplis. Au départ, huit provinces étaient parties à cette entente de collaboration qui a mené à la publication du premier rapport annuel pour le Canada en 1921. Le Québec s'est joint aux autres provinces en 1926, et Terre-Neuve, en 1949. Les données des territoires ont été incluses dans les publications régulières pour la première fois en 1950.

Objectifs

Aujourd'hui, tout comme au début, l'enregistrement complet et exact de tous les événements relatifs à l'état civil au Canada est le principal objectif de ce travail de collaboration entre les provinces, les territoires et Statistique Canada. Aux termes d'une entente fédérale-provinciale, l'enregistrement des naissances, des mortinaissances, des décès et des mariages relève des provinces et territoires. Les systèmes d'enregistrement des provinces et territoires visent avant tout à obtenir et à conserver les preuves documentaires nécessaires pour protéger les droits de chaque personne. À n'importe quel moment après l'enregistrement, la personne ou la famille concernée peut consulter les registres pour avoir une preuve des faits se rapportant à une naissance, une mortinaissance, un décès ou un mariage.

Bien que la production de statistiques soit d'une importance secondaire pour les bureaux provinciaux et territoriaux de l'état civil, les données sont beaucoup utilisées par les chercheurs et les professionnels de la santé. À l'échelle nationale, on utilise principalement les données à

population estimates and projections, demographic trend analyses, health surveillance and epidemiological research.

Scope and Dissemination

The vital statistics birth and death registration system covers all births and deaths occurring in Canada. As well, births and deaths of Canadian residents occurring in the United States are reported under a reciprocal agreement. Unless otherwise indicated, tabulations exclude births and deaths of non-Canadian residents that occurred in Canada.

The Canadian mortality data are published in standard tables. In addition to these tables, other data in the form of more detailed cross-tabulations, custom tabulations, computer printouts, diskettes and magnetic tapes are available on a cost-recovery basis from the Health Statistics Division or Statistics Canada Reference Centres.

METHODOLOGY

Data Collection

Provincial and territorial Vital Statistics Acts or equivalent legislation render compulsory the registration of all births and deaths within their jurisdictions. These Acts follow, as closely as possible, a Model Vital Statistics Act that was developed to promote uniformity of legislation and reporting practices among the provinces and territories.

While the vital statistics registration system covers all births and deaths occurring in Canada, the tables of this publication exclude those of non-Canadian residents. Births and deaths of Canadian residents occurring in the United States are also included, being reported under a reciprocal agreement. However, no births or deaths of Canadian residents occurring in countries other than Canada and the United States are reported.

The Canadian Vital Statistics system operates under an agreement between the government of Canada and governments of the provinces and territories. An advisory committee, the Vital Statistics Council for Canada, oversees policy and operational matters. All provincial and territorial jurisdictions and Statistics Canada are represented on the Vital Statistics Council. Under the agreement, all registrars collect a specified set of data elements, although any of them may decide to collect additional information.

The form for the registration of a birth is completed by the parents, who are responsible for filing it with the local registrar. The central Vital Statistics Registry in each province and territory provides data from birth registration forms to Statistics Canada. The following birth variables are reported by all jurisdictions to the Canadian Vital Statistics system:

des fins statistiques, par exemple, pour les estimations et les projections démographiques, l'analyse des tendances démographiques, la surveillance de la santé et la recherche épidémiologique.

Envergure et diffusion

Le système d'enregistrement des naissances et des décès couvre tous les naissances et les décès qui se produisent au Canada. En outre, les naissances et les décès des résidents canadiens aux États-Unis sont déclarés en vertu d'une entente réciproque. Sauf indication contraire, les totalisations excluent les naissances et les décès au Canada de personnes qui ne sont pas des résidentes canadiennes.

Les données canadiennes sur la mortalité sont publiées dans des tableaux de base. Outre ces tableaux, on peut se procurer d'autres données sous forme de tableaux croisés plus détaillés, de totalisations spéciales, d'imprimés, de disquettes et de bandes magnétiques en s'adressant à la Division des statistiques sur la santé ou aux Centres de référence de Statistique Canada.

MÉTHODOLOGIE

Collecte des données

Les lois provinciales et territoriales sur les statistiques de l'état civil ou les textes législatifs équivalents rendent obligatoire l'enregistrement de toutes les naissances et décès dans la province ou le territoire. Ces lois se rapprochent le plus possible d'une loi modèle sur les statistiques de l'état civil, qu'on a rédigée afin d'assurer l'uniformité des lois et des méthodes de déclaration des provinces et territoires.

Alors que le système d'enregistrement couvre toutes les naissances et les décès qui se produisent au Canada, les tableaux de cette publication excluent celles de non-résidents canadiens se produisant au Canada. Les naissances et les décès de résidents canadiens se produisant aux États-Unis sont aussi incluses, étant rapportées en vertu d'une entente réciproque mais, aucun se produisant dans d'autres pays ne l'est.

Une entente entre le gouvernement du Canada et les gouvernements des provinces et territoires régit le fonctionnement du système canadien des statistiques de l'état civil. Un comité consultatif, le Conseil de la statistique de l'état civil du Canada, s'occupe des politiques et des questions opérationnelles. Les provinces et territoires ainsi que Statistique Canada sont tous représentés à ce Conseil. Aux termes de l'entente, les registraires collectent une certaine série d'information standard mais chacun peut recueillir des renseignements supplémentaires.

Le formulaire d'enregistrement d'une naissance est rempli par les parents qui doivent le déposer au registraire local. Le bureau central de l'état civil de chaque province et territoire fournit à Statistique Canada les données tirées des formulaires d'enregistrement des naissances. Les variables suivantes sont rapportées par toutes les provinces et les territoires pour être incluses dans le système canadien :

- date and place of birth;
- sex and weight of the newborn;
- age, marital status and birthplace of both parents;
- place of residence of the mother:
- type of birth (single or multiple);
- parity:
- duration of gestation.

The form for the registration of a death consists of two parts: personal and medical. Personal data are supplied to the undertaker by an informant, usually a relative of the deceased. The part of the form comprising the medical certificate of death is completed by the medical practitioner last in attendance, or by a coroner if an inquest or enquiry was held. The undertaker, or person acting as the undertaker, enters details on burial or other disposition of the body on the death registration form, and is responsible for filing the completed form with the local registrar, who then issues the burial permit.

The following death variables are reported by all jurisdictions to the Canadian Vital Statistics system:

- age, sex, marital status, place of residence and birthplace of the deceased;
- date of death;
- underlying cause of death;
- place where death occurred;
- place of accident (for most non-transport accidental deaths):
- autopsy (whether one was held, and if so, whether the results of it were taken into account in establishing the cause of death).

Data Processing

All provinces and territories (except Ontario from 1990-1994) supply microfilm copies or optical images of registration forms to Statistics Canada. In addition, New Brunswick, Quebec, Ontario and the western provinces supply machine-readable abstracts of registrations, consisting of the required standard information. For the other Atlantic provinces and the territories, the required standard information on microfilm is converted to machine-readable format at Statistics Canada. Subsequent changes to registrations due to errors or omissions are transmitted to Statistics Canada as the information becomes available.

Processing before Receipt by Statistics Canada

The provinces that supply data in machine-readable form also carry out edits before sending them. Editing varies by province, but usually includes checks that data are present, validation of code ranges for coded information, and

- date et lieu de naissance:
- sexe et poids du nouveau-né;
- âge, état matrimonial et lieu de naissance des deux
- lieu de résidence de la mère:
- type de naissance (simple ou multiple);
- rang de naissance;
- durée de gestation.

Le formulaire d'enregistrement de décès se divise en deux parties, soit les renseignements personnels et les renseignements médicaux. Les renseignements personnels sont fournis par un répondant, habituellement un parent de la personne décédée, à l'entrepreneur en pompes funèbres. La partie du formulaire qui correspond au certificat médical de décès est remplie par le médecin qui a constaté le décès, ou par le coroner dans les cas où il y a une enquête. L'entrepreneur en pompes funèbres, ou la personne qui joue ce rôle, doit inscrire sur le formulaire d'enregistrement de décès les détails concernant l'enterrement ou toute autre disposition à prendre relativement au cadavre et, doit présenter le formulaire rempli au registraire local, qui délivrera le permis d'enterrement.

Les variables suivantes sont rapportées par toutes les provinces et les territoires pour être incluses dans le système canadien :

- âge, sexe, état matrimonial, lieu de résidence et lieu de naissance de la personne décédée
- date du décès:
- cause antécédente du décès:
- le lieu de décès:
- lieu de l'accident (pour la plupart des décès accidentels non reliés au transport);
- autopsie (si on en a fait une, et, si oui, si les résultats de l'autopsie ont été pris en compte dans l'établissement de la cause du décès).

Traitement des données

Toutes les provinces et territoires (sauf l'Ontario de 1990 à 1994) fournissent à Statistique Canada des copies sur microfilm ou des images optiques des formulaires d'enregistrement. En outre, le Nouveau-Brunswick, le Québec, l'Ontario et les provinces de l'Ouest extraient des formulaires les données de base requises et les transmettent à Statistique Canada sous une forme lisible par machine. Pour les autres provinces atlantiques et les territoires, c'est Statistique Canada qui s'occupe de mettre sous une forme lisible par machine les données de base qui lui sont fournies sur microfilm. Les modifications à apporter aux enregistrements à cause d'erreurs ou d'omissions sont communiquées immédiatement à Statistique Canada.

Traitement avant l'envoi des données à Statistique Canada

Les provinces qui envoient des données sous une forme lisible par machine, effectuent des vérifications avant de les envoyer. Les vérifications varient d'une province à l'autre mais incluent habituellement des vérifications de la présence des

consistency checks between related data elements, such as birthweight and period of gestation, and marital status and age.

Statistics Canada provides provinces with training and consultation for cause of death coding and supplies manuals, such as the *International Classification of Diseases* (ICD) (1) and the *Standard Geographical Classification* (SGC) (2), to promote data reliability and consistency.

Processing at Statistics Canada

For the Atlantic provinces and the territories, the cause of death is coded at Statistics Canada. Geographic information is coded for the Yukon as well as for all births and deaths of non-residents of the province of occurrence. For deaths of Canadian residents reported by the United States, both nosological and geographic information are coded at Statistics Canada. Machine-readable files provided by provinces are converted to a standard format at Statistics Canada.

The data from all provinces and territories then undergo the same edit routines to ascertain the completeness and quality of the data. Currently, standard edit specifications are being developed by Statistics Canada for inclusion in provincial edit systems. Most errors and omissions detected during processing are corrected by referring to the microfilmed registrations and by consulting the provinces and territories.

Since 1990, Ontario has used optical imaging technology for storing copies of legal certificates, so microfilm copies are no longer produced. Statistics Canada has recently developed an agreement for the physical transfer of optical images from Ontario to Statistics Canada. It has been possible to edit the 1995 death data reported by Ontario but not the births. For these, invalid codes are changed to the "not stated" category, and unlikely situations are accepted as reported.

données, une validation des codes pour les données codées et des vérifications de cohérence entre les éléments d'information connexes tels que le poids à la naissance et la durée de gestation et, l'état matrimonial et l'âge.

Statistique Canada offre aux provinces des cours de formation et des services de consultation sur le codage de la cause du décès et leur fournit des manuels comme la Classification internationale des maladies (CIM) (1) et la Classification géographique type (CGT) (2) afin de favoriser la fiabilité et la cohérence des données.

Traitement à Statistique Canada

Pour les provinces de l'Atlantique et les territoires, la cause du décès est codée à Statistique Canada. C'est également le Bureau qui s'occupe de coder les renseignements géographiques pour le Yukon ainsi que pour toutes les naissances et les décès de personnes qui ne sont pas résidents de la province où a eu lieu le décès. Pour les décès de résidents canadiens déclarés par les État-Unis, les renseignements nosologiques et géographiques sont codés à Statistique Canada. Les fichiers lisibles sur machine fournis par les provinces sont convertis à Statistique Canada de façon à respecter un format normalisé.

Les données de toutes les provinces et territoires font ensuite l'objet des mêmes vérifications visant à en mesurer l'intégralité et la qualité. Statistique Canada est en train d'élaborer des spécifications concernant un programme normalisé de vérification qui sera intégré aux systèmes provinciaux de vérification. Dans la plupart des cas, on consulte les enregistrements sur microfilm ou on communique avec les provinces et les territoires pour corriger les erreurs et les omissions décelées pendant le traitement.

Depuis 1990, l'Ontario utilise la technologie de l'imagerie optique pour le stockage des copies des certificats légaux qui ne sont plus copiées sur microfilm. Statistique Canada a développé tout dernièrement un accord pour le transfert des images optiques de l'Ontario à Statistique Canada. Il a été possible de vérifier les données statistiques de décès de 1995 déclarées par l'Ontario, mais pas celles des naissances. Pour celles-ci, les codes invalides sont classés dans la catégorie "non précisé", et les situations peu plausibles sont acceptées telles qu'elles ont été déclarées.

Definitions

The definitions used for the production of the statistical tables are based on those recommended by the World Health Organization (ICD-9, 1975) and the United Nations (*Principles and Recommendations for a Vital Statistics System, 1973*).

Live birth. Complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy, which, after such separation, breathes or shows any other evidence of life.

Stillbirth. A product of conception which has issued forth from its mother and did not at any time after birth breathe or show other signs of life. In the statistical tables, periods of gestation of 20 and 28 weeks are used.

Total births. Total number of live births and stillbirths.

Multiple birth. Birth in which more than one infant is born, including live births and stillbirths.

Birthweight. First weight of the fetus or newborn obtained after birth, expressed in grams. Low birthweight is less than 2,500 grams. Very low birthweight is less than 1,500 grams. Extremely low birthweight is less than 1,000 grams.

Duration of gestation. Interval, in completed weeks, between the first day of the last menstrual period of the mother and the day of delivery. Also, any estimate of that interval based on ultrasound, physical examination or other method. The method of calculation of gestational age is not specified in Canadian birth registration documents. *Pre-term* refers to a period of gestation of less than 37 completed weeks; *term*, 37 through 41 completed weeks; and *post-term*, 42 or more completed weeks.

Death. Permanent disappearance of all evidence of life at any time after a live birth has taken place. Stillbirths are excluded from death statistics unless otherwise indicated.

Infant death. Death to a child under one year of age.

Perinatal death. Death to a child under one week of age (<7 days) or a stillborn of 28 weeks or more gestation.

Neonatal death. Death to a child under four weeks of age (<28 days).

Post-neonatal death. Death to a child between 28 days and one year of age (28-364 days).

Définitions

Les définitions utilisées pour la production des tableaux statistiques sont celles recommandées par l'Organisation mondiale de la santé (CIM-9, 1975) et les Nations Unies (*Principles and Recommendations for a Vital Statistics System, 1973*).

Naissance vivante. Expulsion ou extraction complète du corps de la mère, indépendamment de la durée de la gestation, d'un produit de conception qui, après cette séparation, respire ou manifeste tout autre signe de vie.

Mortinaissance. Un produit de la conception issu du corps de la mère et qui, après cette séparation, ne respire ni ne manifeste aucun signe de vie. Dans les tableaux statistiques, on utilise des périodes de gestation de 20 et de 28 semaines.

Naissances totales. Nombre total de naissances vivantes et de mortinaissances.

Naissance multiple. Naissance au cours de laquelle plus d'un enfant naît, comptent les naissances vivantes et les mortinaissances.

Poids à la naissance. Résultat de la première pesée du foetus ou du nouveau-né effectué immédiatement après la naissance, exprimé en grammes. Le poids faible à la naissance est inférieur à 2,500 grammes de poids très faibles à la naissance est inférieur à 1 500 grammes. Le poids extrèmement faible à la naissance est inférieur à 1 000 grammes.

Durée de gestation. Intervalle, en semaines révolues, entre le premier jour de la dernière période menstruelle de la mère et le jour de l'accouchement. De plus, une estimation basée sur un examen physique, d'ultrason, ou d'autre méthode. La méthode de calcul de la durée de gestation n'est pas spécifiée sur les formulaires d'enregistrement de naissances au Canada. Avant terme réfère à une période de moins de 37 semaines entières, à terme, une période de 42 semaines entières ou davantage.

Décès. Disparition permanente de tout signe de vie à tout moment après une naissance vivante. Les mortinaissances ne sont pas prises en compte dans les statistiques des décès, sauf indication contraire.

Mortalité infantile. Décès d'un enfant de moins d'un an.

Mortalité périnatale. Décès d'un enfant de moins d'une semaine (<7 jours) ou d'un enfant mort-né de 28 semaines ou plus de gestation.

Mortalité néonatale. Décès d'un enfant de moins de quatre semaines (<28 jours).

Mortalité post-néonatale. Décès d'un enfant âgé de 28 jours à un an (28-364 jours).

Maternal death. Death to a mother due to complications during pregnancy, childbirth or the puerperium.

Age. Age at the last birthday preceding the event. In the case of infant deaths, the completed number of days (or hours, minutes or months) since birth.

Marital status. The legal conjugal status at the time of the event. A common-law union is not regarded as a legal conjugal status.

Single. A person who has never been married, or a person whose marriage has been annulled and who has not remarried.

Married. A person who is legally married and who is not separated.

Widowed. A person whose spouse has died and who has not remarried.

Divorced. A person who has obtained a legal divorce and who has not remarried.

Separated. A person who is legally married and who is not living with his or her spouse because the couple no longer wants to live together, but who has not obtained a divorce.

Province or Territory of Residence

Population Estimates

The population of Canada includes persons whose usual place of residence is somewhere in Canada, including Canadian government employees stationed abroad and their families, members of the Canadian Armed Forces stationed abroad and their families, crews of Canadian merchant vessels, and non-permanent residents. The mid-year population (on July 1) is used in the calculation of rates.

Net census undercoverage is the difference between census undercoverage and census overcoverage. The former refers to persons not enumerated in the census but who were part of the census universe; the latter, to persons either

Mortalité maternelle. Décès résultant des complications de la grossesse, de l'accouchement et des suites des couches.

Âge. Âge au dernier anniversaire précédant l'événement. Dans le cas de la mortalité infantile, nombre de jours (ou heures, minutes ou mois) révolus depuis la naissance.

État matrimonial. Situation conjugale légale au moment de l'événement. L'union libre n'est pas considérée comme un état matrimonial légal.

Célibataire. Personne qui n'a jamais été mariée, ou personne dont le mariage a été annulé et qui ne s'est pas remariée.

Marié/mariée. Personne qui est légalement mariée et qui n'est pas séparée.

Veuf/veuve. Personne dont le conjoint est mort et qui ne s'est pas remariée.

Divorcé/divorcée. Personne qui a obtenu un divorce légal et qui ne s'est pas remariée.

Séparé/séparée. Personne qui est légalement mariée, qui ne vit pas avec son conjoint parce que le couple ne veut plus vivre ensemble, mais qui n'a pas obtenu de divorce.

Estimations de population

La population du Canada comprend les personnes dont le lieu habituel de résidence se trouve au Canada, et comprenant les employés du gouvernement canadien en poste à l'étranger et leurs familles, les membres des Forces armées canadiennes en poste à l'étranger et leurs familles, les équipages des navires marchands canadiens et des résidents non-permanent. La population au milieu de l'année (1er juillet) sert au calcul des taux.

Le sous-dénombrement net au recensement est la différence entre le sous-dénombrement et le surdénombrement au recensement. Le premier désigne les personnes qui n'ont pas été dénombrées mais qui enumerated more than once or enumerated but not part of the census universe.

Non-permanent residents are persons claiming refugee status, holding a student authorization, holding an employment authorization, holding a Minister's permit, and all non-Canadian-born dependents of the above individuals.

On December 2, 1998, the Demography Division released newly revised population estimates for 1971-1998, which were used as denominators for most of the rates shown here. However, for mortality at age <1 year, the number of live births was used in place of the population estimate, and for mortality at ages 1-4 years, the denominator is the population estimate for ages 0-4 years, less the number of live births.

Calculation of Rates

Previously, vital statistics rates were calculated using denominators that did not include persons missed in the census and persons with authorization to reside temporarily in Canada, while the numerators generally included these two groups.

Beginning in 1992, the Health Statistics Division has used adjusted population estimates to calculate all rates for its standard data products and publications. Therefore, rates in this publication may differ from those in publications released before 1992. The adjustment was introduced to better reflect Canada's population. The adjusted estimates differ from the previous ones in that they include adjustments for net census undercoverage; they include estimates for non-permanent residents; and the reference date for annual estimates is July 1.

Measures and Indices

Crude birth or death rates

Number of live births or deaths per 1,000 population.

Mean and median

Measures of central tendency. The *mean* is calculated by summing observations weighted by their relative frequency. The *median* is the point in a frequency distribution such that half of the observations fall above it and half below it.

Fertility rates

The general fertility rate is the number of live births per 1,000 women aged 15-49.

appartenaient à l'univers du recensement; le second, les personnes qui ont été dénombrées plus d'une fois, ou qui l'ont été, mais qui ne faisaient pas partie de l'univers du recensement

Les résidents non permanents sont les personnes qui revendiquent le statut de réfugié, détiennent un permis d'étude, détiennent un permis de travail, détiennent un permis du Ministre, ainsi que toutes les personnes à charge de cellesci et qui ne sont pas nées au Canada.

Le 2 décembre 1998, la Division de la Démographie a diffusé de nouvelles estimations révisées de la population pour les années 1971-1998 inclusivement, lesquelles ont servies de dénominateurs pour la plupart des taux indiqués ici. Néanmoins, en ce qui concerne la mortalité infantile (<1 an), nous avons utilisé plutôt le nombre de naissances vivantes, et pour la mortalité à l'âge de 1-4 ans, nous avons utilisé l'estimation de la population de 0-4 ans, moins le nombre de naissances vivantes.

Calcul des taux

Auparavant, les taux étaient calculés à l'aide de dénominateurs qui ne comprenaient pas les personnes oubliées au recensement ni les personnes autorisées à résider temporairement au Canada, alors que les numérateurs les comprenaient le plus souvent.

Depuis 1992, la Division des statistiques de la santé a utilisé les estimations corrigées de la population pour calculer tous les taux de ses produits et publications de données standards. À ce titre, les taux de cette publication peuvent différer de ceux des publications antérieures à 1992. On a apporté cette correction afin de mieux représenter la population du Canada. Les estimations corrigées diffèrent des estimations précédentes de la façon suivante : elles comprennent des corrections pour le sous-dénombrement net au recensement; elles comprennent des estimations pour les résidents non permanents; la date de référence des estimations annuelles est le 1er juillet.

Mesures et indices

Taux bruts de natalité ou de mortalité

Nombre de naissances vivantes ou de décès pour 1,000 habitants.

Moyenne et médiane

Mesures de tendance centrale. On calcule la moyenne en prenant la somme des observations pondérées selon leur fréquence relative. La médiane est le point d'une distribution de fréquences tel que la moitié des observations se retrouve au-dessus, et la moitié, au-dessous.

Taux de fécondité

Le taux général de fécondité est le nombre de naissances vivantes pour 1,000 femmes âgées de 15 à 49 ans.

The general marital fertility rate is the number of live births to married women per 1,000 married women aged 15-49.

The age-specific fertility rate is the number of live births per 1,000 women in a specific age interval. Five-year age groups are usually used (15-19, ..., 45-49).

The age-specific marital fertility rate is the number of live births per 1,000 married women in a specific age interval.

The total fertility rate is the average number of children a woman can expect to have in her lifetime, based on the age-specific fertility rates of a given year. It is equal to the sum of the age-specific fertility rates (ages 15 to 49).

Death rates

The age-specific death rate is the number of deaths per 1,000 population in a specific age interval.

An age-standardized death rate is a weighted average of the age-specific death rates, using as weights the age distribution of a standard population.

Life expectancy is a statistic included in life tables. It is the average number of remaining years of life, at birth or other ages, based on a set of age-specific death rates at a given year.

The infant mortality rate is the number of infant deaths per 1,000 live births. The same denominator is used for neonatal and post-neonatal mortality rates and for stillbirth rates.

The perinatal mortality rate is the number of late fetal deaths (28+ weeks gestation) plus early neonatal deaths (< 7 days) per 1,000 total births.

The maternal death rate is the number of maternal deaths per 10,000 live births.

DATA QUALITY

Coverage

Due to legal reporting requirements, registration of births and deaths is considered to be virtually complete. However, records received after a "cut-off date" and births and deaths occurring to Canadians in countries other than Canada or the United States are missing. Furthermore, births and deaths of non-permanent residents in Canada may be excluded if the declared usual place of residence of the mother or of the deceased is not Canada. These result in some undercoverage.

Le taux général de fécondité légitime est le nombre de naissances vivantes pour 1,000 femmes mariées de 15 à 49 ans

Taux de fécondité par âge est le nombre de naissances vivantes pour 1,000 femmes dans un intervalle d'âge donné. On utilise habituellement des groupes d'âge de cinq ans (15-19, ..., 45-49).

Le taux de fécondité légitime par âge est le nombre de naissances vivantes pour 1,000 femmes mariées dans un intervalle d'âge donné.

L'indice synthétique de fécondité est le nombre moyen d'enfants qu'une femme aurait au cours de sa vie selon les conditions de fécondité d'une année donnée; somme des taux de fécondité par âge (15 à 49 ans).

Taux de mortalité

Le taux de mortalité par âge est le nombre de décès pour 1,000 personnes dans un intervalle d'âge donné.

Le taux de mortalité normalisé selon l'âge est la moyenne des taux de mortalité par âge pondérée par la distribution par âge d'une population standard.

L'espérance de vie est une statistique figurant dans les tables de mortalité. C'est la vie moyenne calculée à la naissance ou aux différents anniversaires, selon les conditions de mortalité d'une année donnée.

Le taux de mortalité infantile est le nombre de décès infantiles pour 1,000 naissances vivantes. Le même dénominateur sert pour les taux de mortalité néonatale et post-néonatale ainsi que pour le taux de mortinaissance.

Le taux de mortalité périnatale est le nombre de décès foetals tardifs (28+ semaines de gestation) et décès néonatals précoces (< 7 jours) pour 1,000 naissances totales.

Le taux de mortalité matemelle est le nombre de décès maternels pour 10,000 naissances vivantes.

QUALITÉ DES DONNÉES

Couverture

Comme l'enregistrement des naissances et des décès est exigé par la loi, les données sur les naissances et les décès sont considérées comme presque complètes. Cependant, les enregistrements reçus après la date limite et les naissances et les décès de Canadiens se produisant dans des pays autres que le Canada et les États-Unis sont manquantes. De plus, des naissances et des décès de résidents non permanents au Canada ont pu être exclus si le lieu habituel de résidence déclaré de la mère ou du décédé n'est pas le Canada. Ceci résulte en un certain sous-enregistrement.

In 1991, an agreement was signed with the province of Newfoundland that allowed Statistics Canada to use data from the Physician Notification of Births (PNOB) file, obtained from the Newfoundland Department of Health, which are more complete, both in terms of registered births and collected variables, than those from the provincial Registrar. Before 1991, the Registrar provided only counts of births that usually had to be adjusted for under-enumeration.

Quality Indicators

Quality assessment studies (3,4) conducted on a sample of 1981 records for ten provinces indicated that error rates for most variables were quite low. Concerns at that time related to the residence of the deceased at the local area level and to the underlying cause of death, two variables that are not included in this publication.

Completeness

The reponse rate of reporting of core statistical data items varies with the item, the reporting province or territory and the year. The response rate is defined here as the percentage of records for which the value of the data item is neither unknown nor not stated. In most provinces and territories, it was close to 100% when the item was reported at all. Analyses using a variable with a relatively low reponse rate may be biaised by differences between the characteristics of individuals for whom the information is not provided and individuals with valid responses.

Timeliness

Data are usually available towards the end of the year following the data year and the tabulations shortly thereafter.

En 1991, un accord était signé avec la province de Terre-Neuve permettant à Statistique Canada d'utiliser les données provenant du fichier médical de notification des naissances (PNOB) du Ministère de la santé de Terre-Neuve, qui sont plus complètes, autant quant au nombre de naissances enregistrées qu'à celui des variables recueillies, que celles du Registraire de la province. Avant 1991, le Registraire ne fournissait que les nombres totaux de naissances qui devaient, le plus souvent, être corrigés d'un certain sousenregistrement.

Indicateurs de qualité

Des études d'évaluation de la qualité(3,4), effectuée sur un échantillon d'enregistrements de 1981 pour les dix provinces, avait indiqué des taux d'erreur assez bas pour la plupart des variables. On était préoccupé à ce moment-là du lieu de résidence du défunt à l'échelle infra-provinciale et de la cause sous-jacente du décès, deux variables qui ne font pas partie de cette publication.

Intégralité

Le taux de réponse des principaux éléments d'information varie selon l'élément, la province ou le territoire déclarant et l'année. Le taux de réponse est défini ici comme le pourcentage d'enregistrements où la valeur d'un élément donné n'est ni inconnue ni laissée en blanc. Dans la plupart des provinces et territoires, le taux de réponse était près de 100% quand la variable était rapportée. Les analyses portant sur une variable dont le taux de réponse est relativement faible peuvent être biaisées par des différences dans les caractéristiques des répondants et des non-répondants.

Actualité

Les données sont habituellement disponibles vers la fin de l'année suivant l'année de données, et les totalisations peu de temps après.

⁽¹⁾ Including unknown gestation age, since only births of 500 g or 20 wks gestation are reportable as stillbirths in Canada

⁽¹⁾ Comprend durée de gestation inconnue, puisque seules les naissances de 500 g et plus ou d'au moins 20 semaines de gestation sont déclarables comme mort-nés au Canada.

⁽²⁾ Excluding unknown gestational age, for comparability with most previous publications of this Division.

About half of all stillbirths with known gestational age were of 28 + weeks gestation.

⁽²⁾ Excluant durée de gestation inconnue, pour faciliter la comparaison avec la plupart des publications de cette Division; environ la moitié des mortinaissances dont la durée de gestation était connue avait une durée de gestation d'au moins 28 semaines.

Note of Appreciation

Canada owes the success of its statistical system to a long-standing cooperation involving Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

The cooperation of provincial and territorial Vital Statistics registries who supply the data in this report to Statistics Canada is gratefully acknowledged.

How to obtain information

Orders or inquiries about this product and related statistics or services should be directed to: Client Custom Services Unit, Health Statistics Division, Statistics Canada, Ottawa, Ontario, K1A 0T6 (telephone 1-613-951-1746)

 Section de données sur la santé et l'état civil
- Russell Wilkins, analyste principal Section des données sur la santé et l'état civil

Note de reconnaissance

Le succès du système statistique du Canada repose sur un partenariat bien établi entre Statistique Canada et la population, les entreprises, les administrations canadiennes et les autres organismes. Sans cette collaboration et cette bonne volonté, il serait impossible de produire des statistiques précises et actuelles.

Statistique Canada tient à manifester sa gratitude envers les provinces et territoires qui nous ont fourni de leurs registres des statistiques de l'état civil, les données qui apparaissent dans ce rapport.

Comment obtenir d'autres renseignements

Toute commande ou demande de renseignements au sujet du présent produit ou au sujet de statistiques ou de services connexes doit être adressée à : Services à la clientèle personnalisés, Division des statistiques sur la santé, Statistique Canada, Ottawa, Ontario K1A 0T6 (téléphone : 1-613-951-1746).

INTRODUCTION

History

The collection of vital statistics began in Canada, as in France and England, with the registration by the ecclesiastical authorities of baptisms, marriages and burials. These registers have made it possible to compile vital statistics for Quebec since 1610.

For Canada as a whole, it was impossible to compile a satisfactory series of vital statistics prior to 1921. Obstacles to such a national compilation included variations in the vital statistics legislation among provinces, incompleteness of registration, lack of uniformity in classification and method of presentation, omission of important data and choice of fiscal instead of calendar year as the time unit.

In 1918, the Dominion Bureau of Statistics (DBS, now Statistics Canada) was established by the Statistics Act. Two Dominion-Provincial Conferences held in the same year established the mechanism for the DBS and the provincial Vital Statistics Offices to produce national vital statistics. In this cooperative scheme, DBS would supply the standard registration forms for births, stillbirths, deaths and marriages to the provinces, who would return transcripts of the completed forms to DBS. Eight provinces initially entered into the cooperative system, leading to publication of the first annual report for Canada in 1921. Quebec entered in 1926, and Newfoundland in 1949. Data from the territories were first included in the regular publications in 1950.

Purposes

Now, as in the early years, the complete and accurate registration of all "vital" events in Canada is the main objective of this collaborative effort among the provinces, the territories and Statistics Canada. Under a federal-provincial agreement, the registration of births, stillbirths, deaths and marriages is the responsibility of the provinces and territories. The primary function of the provincial and territorial registration systems is to obtain and preserve such documentary evidence as is necessary to protect the legal rights of the individual. At any time after registration, the individual or family concerned may refer to the records for proof of the pertinent facts concerning a birth, stillbirth, death or marriage.

While the production of statistics is of secondary importance to the provincial and territorial registries of vital statistics, the data are used extensively by the research community and other health professionals. At the national level, the primary use of the data is statistical, such as in

INTRODUCTION

Historique

Au Canada, comme en France et en Angleterre, les premières données sur l'état civil ont été recueillies par les autorités ecclésiastiques, qui enregistraient les baptêmes, les mariages et les enterrements. Ces registres ont permis de compiler des statistiques de l'état civil pour le Québec depuis 1610.

Pour le Canada tout entier, il n'a pas été possible de compiler une série satisfaisante de statistiques de l'état civil avant 1921. Parmi les obstacles qui ont nui à la compilation de ce genre de statistiques à l'échelle nationale, mentionnons les différences entre les lois provinciales à cet égard, les lacunes dans l'enregistrement, le manque d'uniformité dans la classification ou dans la méthode de présentation, l'omission de données importantes et le choix de l'année financière au lieu de l'année de calendrier comme unité de temps.

En 1918, le Bureau fédéral de la statistique (BFS, maintenant Statistique Canada) était créé en vertu de la Loi sur la statistique. C'est au cours de deux conférences fédérales-provinciales tenues cette même année que le BFS et les bureaux provinciaux de l'état civil ont conclu une entente de collaboration en vue de produire des données nationales sur l'état civil. Selon cette entente de collaboration, le BFS devait fournir les formulaires d'enregistrement normalisés pour les naissances, les mortinaissances, les décès et les mariages aux provinces qui devaient lui renvoyer des copies des formulaires remplis. Au départ, huit provinces étaient parties à cette entente de collaboration qui a mené à la publication du premier rapport annuel pour le Canada en 1921. Le Québec s'est joint aux autres provinces en 1926. et Terre-Neuve, en 1949. Les données des territoires ont été incluses dans les publications régulières pour la première fois en 1950.

Objectifs

Aujourd'hui, tout comme au début, l'enregistrement complet et exact de tous les événements relatifs à l'état civil au Canada est le principal objectif de ce travail de collaboration entre les provinces, les territoires et Statistique Canada. Aux termes d'une entente fédérale-provinciale, l'enregistrement des naissances, des mortinaissances, des décès et des mariages relève des provinces et territoires. Les systèmes d'enregistrement des provinces et territoires visent avant tout à obtenir et à conserver les preuves documentaires nécessaires pour protéger les droits de chaque personne. À n'importe quel moment après l'enregistrement, la personne ou la famille concernée peut consulter les registres pour avoir une preuve des faits se rapportant à une naissance, une mortinaissance, un décès ou un mariage.

Bien que la production de statistiques soit d'une importance secondaire pour les bureaux provinciaux et territoriaux de l'état civil, les données sont beaucoup utilisées par les chercheurs et les professionnels de la santé. À l'échelle nationale, on utilise principalement les données à

population estimates and projections, demographic trend analyses, health surveillance and epidemiological research.

des fins statistiques, par exemple, pour les estimations et les projections démographiques, l'analyse des tendances démographiques, la surveillance de la santé et la recherche épidémiologique.

Scope and Dissemination

The vital statistics birth and death registration system covers all births and deaths occurring in Canada. As well, births and deaths of Canadian residents occurring in the United States are reported under a reciprocal agreement. Unless otherwise indicated, tabulations exclude births and deaths of non-Canadian residents that occurred in Canada.

The Canadian mortality data are published in standard tables. In addition to these tables, other data in the form of more detailed cross-tabulations, custom tabulations, computer printouts, diskettes and magnetic tapes are available on a cost-recovery basis from the Health Statistics Division or Statistics Canada Reference Centres.

METHODOLOGY

Data Collection

Provincial and territorial Vital Statistics Acts or equivalent legislation render compulsory the registration of all births and deaths within their jurisdictions. These Acts follow, as closely as possible, a Model Vital Statistics Act that was developed to promote uniformity of legislation and reporting practices among the provinces and territories.

While the vital statistics registration system covers all births and deaths occurring in Canada, the tables of this publication exclude those of non-Canadian residents. Births and deaths of Canadian residents occurring in the United States are also included, being reported under a reciprocal agreement. However, no births or deaths of Canadian residents occurring in countries other than Canada and the United States are reported.

The Canadian Vital Statistics system operates under an agreement between the government of Canada and governments of the provinces and territories. An advisory committee, the Vital Statistics Council for Canada, oversees policy and operational matters. All provincial and territorial jurisdictions and Statistics Canada are represented on the Vital Statistics Council. Under the agreement, all registrars collect a specified set of data elements, although any of them may decide to collect additional information.

The form for the registration of a birth is completed by the parents, who are responsible for filing it with the local registrar. The central Vital Statistics Registry in each province and territory provides data from birth registration forms to Statistics Canada. The following birth variables are reported by all jurisdictions to the Canadian Vital Statistics system:

Envergure et diffusion

Le système d'enregistrement des naissances et des décès couvre tous les naissances et les décès qui se produisent au Canada. En outre, les naissances et les décès des résidents canadiens aux États-Unis sont déclarés en vertu d'une entente réciproque. Sauf indication contraire, les totalisations excluent les naissances et les décès au Canada de personnes qui ne sont pas des résidentes canadiennes.

Les données canadiennes sur la mortalité sont publiées dans des tableaux de base. Outre ces tableaux, on peut se procurer d'autres données sous forme de tableaux croisés plus détaillés, de totalisations spéciales, d'imprimés, de disquettes et de bandes magnétiques en s'adressant à la Division des statistiques sur la santé ou aux Centres de référence de Statistique Canada.

MÉTHODOLOGIE

Collecte des données

Les lois provinciales et territoriales sur les statistiques de l'état civil ou les textes législatifs équivalents rendent obligatoire l'enregistrement de toutes les naissances et décès dans la province ou le territoire. Ces lois se rapprochent le plus possible d'une loi modèle sur les statistiques de l'état civil, qu'on a rédigée afin d'assurer l'uniformité des lois et des méthodes de déclaration des provinces et territoires.

Alors que le système d'enregistrement couvre toutes les naissances et les décès qui se produisent au Canada, les tableaux de cette publication excluent celles de non-résidents canadiens se produisant au Canada. Les naissances et les décès de résidents canadiens se produisant aux États-Unis sont aussi incluses, étant rapportées en vertu d'une entente réciproque mais, aucun se produisant dans d'autres pays ne l'est.

Une entente entre le gouvernement du Canada et les gouvernements des provinces et territoires régit le fonctionnement du système canadien des statistiques de l'état civil. Un comité consultatif, le Conseil de la statistique de l'état civil du Canada, s'occupe des politiques et des questions opérationnelles. Les provinces et territoires ainsi que Statistique Canada sont tous représentés à ce Conseil. Aux termes de l'entente, les registraires collectent une certaine série d'information standard mais chacun peut recueillir des renseignements supplémentaires.

Le formulaire d'enregistrement d'une naissance est rempli par les parents qui doivent le déposer au registraire local. Le bureau central de l'état civil de chaque province et territoire fournit à Statistique Canada les données tirées des formulaires d'enregistrement des naissances. Les variables suivantes sont rapportées par toutes les provinces et les territoires pour être incluses dans le système canadien :

- date and place of birth:
- sex and weight of the newborn;
- age, marital status and birthplace of both parents:
- place of residence of the mother:
- type of birth (single or multiple):
- parity:
- duration of gestation.

The form for the registration of a death consists of two parts: personal and medical. Personal data are supplied to the undertaker by an informant, usually a relative of the deceased. The part of the form comprising the medical certificate of death is completed by the medical practitioner last in attendance, or by a coroner if an inquest or enquiry was held. The undertaker, or person acting as the undertaker, enters details on burial or other disposition of the body on the death registration form, and is responsible for filing the completed form with the local registrar, who then issues the burial permit.

The following death variables are reported by all jurisdictions to the Canadian Vital Statistics system:

- age, sex, marital status, place of residence and birthplace of the deceased;
- date of death:
- underlying cause of death;
- place where death occurred:
- place of accident (for most non-transport accidental
- autopsy (whether one was held, and if so, whether the results of it were taken into account in establishing the cause of death).

Data Processing

All provinces and territories (except Ontario from 1990-1994) supply microfilm copies or optical images of registration forms to Statistics Canada. In addition, New Brunswick, Quebec, Ontario and the western provinces supply machine-readable abstracts of registrations, consisting of the required standard information. For the other Atlantic provinces and the territories, the required standard information on microfilm is converted to machine-readable format at Statistics Canada. Subsequent changes to registrations due to errors or omissions are transmitted to Statistics Canada as the information becomes available.

Processing before Receipt by Statistics Canada

The provinces that supply data in machine-readable form also carry out edits before sending them. Editing varies by province, but usually includes checks that data are present, validation of code ranges for coded information, and

- date et lieu de naissance:
- sexe et poids du nouveau-né:
- âge, état matrimonial et lieu de naissance des deux parents:
- lieu de résidence de la mère:
- type de naissance (simple ou multiple);
- rang de naissance:
- durée de gestation.

Le formulaire d'enregistrement de décès se divise en deux parties, soit les renseignements personnels et les renseignements médicaux. Les renseignements personnels sont fournis par un répondant, habituellement un parent de la personne décédée, à l'entrepreneur en pompes funèbres. La partie du formulaire qui correspond au certificat médical de décès est remplie par le médecin qui a constaté le décès, ou par le coroner dans les cas où il y a une enquête. L'entrepreneur en pompes funèbres, ou la personne qui joue ce rôle, doit inscrire sur le formulaire d'enregistrement de décès les détails concernant l'enterrement ou toute autre disposition à prendre relativement au cadavre et, doit présenter le formulaire rempli au registraire local, qui délivrera le permis d'enterrement.

Les variables suivantes sont rapportées par toutes les provinces et les territoires pour être incluses dans le système canadien :

- âge, sexe, état matrimonial, lieu de résidence et lieu de naissance de la personne décédée
- date du décès:
- cause antécédente du décès:
- le lieu de décès:
- lieu de l'accident (pour la plupart des décès accidentels non reliés au transport);
- autopsie (si on en a fait une, et, si oui, si les résultats de l'autopsie ont été pris en compte dans l'établissement de la cause du décès).

Traitement des données

Toutes les provinces et territoires (sauf l'Ontario de 1990 à 1994) fournissent à Statistique Canada des copies sur microfilm ou des images optiques des formulaires d'enregistrement. En outre, le Nouveau-Brunswick, le Québec, l'Ontario et les provinces de l'Ouest extraient des formulaires les données de base requises et les transmettent à Statistique Canada sous une forme lisible par machine. Pour les autres provinces atlantiques et les territoires, c'est Statistique Canada qui s'occupe de mettre sous une forme lisible par machine les données de base qui lui sont fournies sur microfilm. Les modifications à apporter aux enregistrements à cause d'erreurs ou d'omissions sont communiquées immédiatement à Statistique Canada.

Traitement avant l'envoi des données à Statistique Canada

Les provinces qui envoient des données sous une forme lisible par machine, effectuent des vérifications avant de les envoyer. Les vérifications varient d'une province à l'autre mais incluent habituellement des vérifications de la présence des

consistency checks between related data elements, such as birthweight and period of gestation, and marital status and age.

Statistics Canada provides provinces with training and consultation for cause of death coding and supplies manuals, such as the *International Classification of Diseases* (ICD) (1) and the *Standard Geographical Classification* (SGC) (2), to promote data reliability and consistency.

Processing at Statistics Canada

For the Atlantic provinces and the territories, the cause of death is coded at Statistics Canada. Geographic information is coded for the Yukon as well as for all births and deaths of non-residents of the province of occurrence. For deaths of Canadian residents reported by the United States, both nosological and geographic information are coded at Statistics Canada. Machine-readable files provided by provinces are converted to a standard format at Statistics Canada.

The data from all provinces and territories then undergo the same edit routines to ascertain the completeness and quality of the data. Currently, standard edit specifications are being developed by Statistics Canada for inclusion in provincial edit systems. Most errors and omissions detected during processing are corrected by referring to the microfilmed registrations and by consulting the provinces and territories.

Since 1990, Ontario has used optical imaging technology for storing copies of legal certificates, so microfilm copies are no longer produced. Statistics Canada has recently developed an agreement for the physical transfer of optical images from Ontario to Statistics Canada. It has been possible to edit the 1995 death data reported by Ontario but not the births. For these, invalid codes are changed to the "not stated" category, and unlikely situations are accepted as reported.

données, une validation des codes pour les données codées et des vérifications de cohérence entre les éléments d'information connexes tels que le poids à la naissance et la durée de gestation et, l'état matrimonial et l'âge.

Statistique Canada offre aux provinces des cours de formation et des services de consultation sur le codage de la cause du décès et leur fournit des manuels comme la Classification internationale des maladies (CIM) (1) et la Classification géographique type (CGT) (2) afin de favoriser la fiabilité et la cohérence des données.

Traitement à Statistique Canada

Pour les provinces de l'Atlantique et les territoires, la cause du décès est codée à Statistique Canada. C'est également le Bureau qui s'occupe de coder les renseignements géographiques pour le Yukon ainsi que pour toutes les naissances et les décès de personnes qui ne sont pas résidents de la province où a eu lieu le décès. Pour les décès de résidents canadiens déclarés par les État-Unis, les renseignements nosologiques et géographiques sont codés à Statistique Canada. Les fichiers lisibles sur machine fournis par les provinces sont convertis à Statistique Canada de façon à respecter un format normalisé.

Les données de toutes les provinces et territoires font ensuite l'objet des mêmes vérifications visant à en mesurer l'intégralité et la qualité. Statistique Canada est en train d'élaborer des spécifications concernant un programme normalisé de vérification qui sera intégré aux systèmes provinciaux de vérification. Dans la plupart des cas, on consulte les enregistrements sur microfilm ou on communique avec les provinces et les territoires pour corriger les erreurs et les omissions décelées pendant le traitement.

Depuis 1990, l'Ontario utilise la technologie de l'imagerie optique pour le stockage des copies des certificats légaux qui ne sont plus copiées sur microfilm. Statistique Canada a développé tout dernièrement un accord pour le transfert des images optiques de l'Ontario à Statistique Canada. Il a été possible de vérifier les données statistiques de décès de 1995 déclarées par l'Ontario, mais pas celles des naissances. Pour celles-ci, les codes invalides sont classés dans la catégorie "non précisé", et les situations peu plausibles sont acceptées telles qu'elles ont été déclarées.

Definitions

The definitions used for the production of the statistical tables are based on those recommended by the World Health Organization (ICD-9, 1975) and the United Nations (*Principles and Recommendations for a Vital Statistics System, 1973*).

Live birth. Complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy, which, after such separation, breathes or shows any other evidence of life.

Stillbirth. A product of conception which has issued forth from its mother and did not at any time after birth breathe or show other signs of life. In the statistical tables, periods of gestation of 20 and 28 weeks are used.

Total births. Total number of live births and stillbirths.

Multiple birth. Birth in which more than one infant is born, including live births and stillbirths.

Birthweight. First weight of the fetus or newborn obtained after birth, expressed in grams. *Low birthweight* is less than 2,500 grams. *Very low birthweight* is less than 1,500 grams. *Extremely low birthweight* is less than 1,000 grams.

Duration of gestation. Interval, in completed weeks, between the first day of the last menstrual period of the mother and the day of delivery. Also, any estimate of that interval based on ultrasound, physical examination or other method. The method of calculation of gestational age is not specified in Canadian birtrh registration documents. *Pre-term* refers to a period of gestation of less than 37 completed weeks; *term*, 37 through 41 completed weeks; and *post-term*, 42 or more completed weeks.

Death. Permanent disappearance of all evidence of life at any time after a live birth has taken place. Stillbirths are excluded from death statistics unless otherwise indicated.

Infant death. Death to a child under one year of age.

Perinatal death. Death to a child under one week of age (<7 days) or a stillborn of 28 weeks or more gestation.

Neonatal death. Death to a child under four weeks of age (<28 days).

Post-neonatal death. Death to a child between 28 days and one year of age (28-364 days).

Définitions

Les définitions utilisées pour la production des tableaux statistiques sont celles recommandées par l'Organisation mondiale de la santé (CIM-9, 1975) et les Nations Unies (*Principles and Recommendations for a Vital Statistics System* 1973)

Naissance vivante. Expulsion ou extraction complète du corps de la mère, indépendamment de la durée de la gestation, d'un produit de conception qui, après cette séparation, respire ou manifeste tout autre signe de vie.

Mortinaissance. Un produit de la conception issu du corps de la mère et qui, après cette séparation, ne respire ni ne manifeste aucun signe de vie. Dans les tableaux statistiques, on utilise des périodes de gestation de 20 et de 28 semaines.

Naissances totales. Nombre total de naissances vivantes et de mortinaissances

Naissance multiple. Naissance au cours de laquelle plus d'un enfant naît, comptent les naissances vivantes et les mortinaissances

Poids à la naissance. Résultat de la première pesée du foetus ou du nouveau-né effectué immédiatement après la naissance, exprimé en grammes. Le poids faible à la naissance est inférieur à 2,500 grammes de poids très faibles à la naissance est inférieur à 1 500 grammes. Le poids extrèmement faible à la naissance est inférieur à 1 000 grammes.

Durée de gestation. Intervalle, en semaines révolues, entre le premier jour de la dernière période menstruelle de la mère et le jour de l'accouchement. De plus, une estimation basée sur un examen physique, d'ultrason, ou d'autre méthode. La méthode de calcul de la durée de gestation n'est pas spécifiée sur les formulaires d'enregistrement de naissances au Canada. Avant terme réfère à une période de moins de 37 semaines entières, à terme, une période de 42 semaines entières ou davantage.

Décès. Disparition permanente de tout signe de vie à tout moment après une naissance vivante. Les mortinaissances ne sont pas prises en compte dans les statistiques des décès, sauf indication contraire.

Mortalité infantile. Décès d'un enfant de moins d'un an.

Mortalité périnatale. Décès d'un enfant de moins d'une semaine (<7 jours) ou d'un enfant mort-né de 28 semaines ou plus de gestation.

Mortalité néonatale. Décès d'un enfant de moins de quatre semaines (<28 jours).

Mortalité post-néonatale. Décès d'un enfant âgé de 28 jours à un an (28-364 jours).

Maternal death. Death to a mother due to complications during pregnancy, childbirth or the puerperium.

Age. Age at the last birthday preceding the event. In the case of infant deaths, the completed number of days (or hours, minutes or months) since birth.

Marital status. The legal conjugal status at the time of the event. A common-law union is not regarded as a legal conjugal status.

Single. A person who has never been married, or a person whose marriage has been annulled and who has not remarried.

Married. A person who is legally married and who is not separated.

Widowed. A person whose spouse has died and who has not remarried.

Divorced. A person who has obtained a legal divorce and who has not remarried.

Separated. A person who is legally married and who is not living with his or her spouse because the couple no longer wants to live together, but who has not obtained a divorce.

Province or Territory of Residence

The following geographic abbreviations are used:

NF Newfoundland

PE Prince Edward Island

NS Nova Scotia

NB New Brunswick

QC Quebec

ON Ontario

MB Manitoba

SK Saskatchewan

AB Alberta

BC British Columbia

YK Yukon

NT Northwest Territories

NU Nunavut

Population Estimates

The population of Canada includes persons whose usual place of residence is somewhere in Canada, including Canadian government employees stationed abroad and their families, members of the Canadian Armed Forces stationed abroad and their families, crews of Canadian merchant vessels, and non-permanent residents. The mid-year population (on July 1) is used in the calculation of rates.

Net census undercoverage is the difference between census undercoverage and census overcoverage. The former refers to persons not enumerated in the census but who were part of the census universe; the latter, to persons either

Mortalité maternelle. Décès résultant des complications de la grossesse, de l'accouchement et des suites des couches.

Âge. Âge au dernier anniversaire précédant l'événement. Dans le cas de la mortalité infantile, nombre de jours (ou heures, minutes ou mois) révolus depuis la naissance.

État matrimonial. Situation conjugale légale au moment de l'événement. L'union libre n'est pas considérée comme un état matrimonial légal.

Célibataire. Personne qui n'a jamais été mariée, ou personne dont le mariage a été annulé et qui ne s'est pas remariée.

Marié/mariée. Personne qui est légalement mariée et qui n'est pas séparée.

Veuf/veuve. Personne dont le conjoint est mort et qui ne s'est pas remariée.

Divorcé/divorcée. Personne qui a obtenu un divorce légal et qui ne s'est pas remariée.

Séparé/séparée. Personne qui est légalement mariée, qui ne vit pas avec son conjoint parce que le couple ne veut plus vivre ensemble, mais qui n'a pas obtenu de divorce.

Province ou territoire de résidence

Estimations de population

La population du Canada comprend les personnes dont le lieu habituel de résidence se trouve au Canada, et comprenant les employés du gouvernement canadien en poste à l'étranger et leurs familles, les membres des Forces armées canadiennes en poste à l'étranger et leurs familles, les équipages des navires marchands canadiens et des résidents non-permanent. La population au milieu de l'année (1er juillet) sert au calcul des taux.

Le sous-dénombrement net au recensement est la différence entre le sous-dénombrement et le surdénombrement au recensement. Le premier désigne les personnes qui n'ont pas été dénombrées mais qui enumerated more than once or enumerated but not part of the census universe

Non-permanent residents are persons claiming refugee status, holding a student authorization, holding an employment authorization, holding a Minister's permit, and all non-Canadian-born dependents of the above individuals.

On December 2, 1998, the Demography Division released newly revised population estimates for 1971-1998, which were used as denominators for most of the rates shown here. However, for mortality at age <1 year, the number of live births was used in place of the population estimate, and for mortality at ages 1-4 years, the denominator is the population estimate for ages 0-4 years, less the number of live births.

Calculation of Rates

Previously, vital statistics rates were calculated using denominators that did not include persons missed in the census and persons with authorization to reside temporarily in Canada, while the numerators generally included these two groups.

Beginning in 1992, the Health Statistics Division has used adjusted population estimates to calculate all rates for its standard data products and publications. Therefore, rates in this publication may differ from those in publications released before 1992. The adjustment was introduced to better reflect Canada's population. The adjusted estimates differ from the previous ones in that they include adjustments for net census undercoverage; they include estimates for non-permanent residents; and the reference date for annual estimates is July 1.

Measures and Indices

Crude birth or death rates

Number of live births or deaths per 1,000 population.

Mean and median

Measures of central tendency. The *mean* is calculated by summing observations weighted by their relative frequency. The *median* is the point in a frequency distribution such that half of the observations fall above it and half below it

Fertility rates

The general fertility rate is the number of live births per 1,000 women aged 15-49.

appartenaient à l'univers du recensement; le second, les personnes qui ont été dénombrées plus d'une fois, ou qui l'ont été, mais qui ne faisaient pas partie de l'univers du recensement

Les résidents non permanents sont les personnes qui revendiquent le statut de réfugié, détiennent un permis d'étude, détiennent un permis de travail, détiennent un permis du Ministre, ainsi que toutes les personnes à charge de cellesci et qui ne sont pas nées au Canada.

Le 2 décembre 1998, la Division de la Démographie a diffusé de nouvelles estimations révisées de la population pour les années 1971-1998 inclusivement, lesquelles ont servies de dénominateurs pour la plupart des taux indiqués ici. Néanmoins, en ce qui concerne la mortalité infantile (<1 an), nous avons utilisé plutôt le nombre de naissances vivantes, et pour la mortalité à l'âge de 1-4 ans, nous avons utilisé l'estimation de la population de 0-4 ans, moins le nombre de naissances vivantes.

Calcul des taux

Auparavant, les taux étaient calculés à l'aide de dénominateurs qui ne comprenaient pas les personnes oubliées au recensement ni les personnes autorisées à résider temporairement au Canada, alors que les numérateurs les comprenaient le plus souvent.

Depuis 1992, la Division des statistiques de la santé a utilisé les estimations corrigées de la population pour calculer tous les taux de ses produits et publications de données standards. À ce titre, les taux de cette publication peuvent différer de ceux des publications antérieures à 1992. On a apporté cette correction afin de mieux représenter la population du Canada. Les estimations corrigées diffèrent des estimations précédentes de la façon suivante : elles comprennent des corrections pour le sous-dénombrement net au recensement; elles comprennent des estimations pour les résidents non permanents; la date de référence des estimations annuelles est le 1er juillet.

Mesures et indices

Taux bruts de natalité ou de mortalité

Nombre de naissances vivantes ou de décès pour 1,000 habitants.

Moyenne et médiane

Mesures de tendance centrale. On calcule la *moyenne* en prenant la somme des observations pondérées selon leur fréquence relative. La *médiane* est le point d'une distribution de fréquences tel que la moitié des observations se retrouve au-dessus, et la moitié, au-dessous.

Taux de fécondité

Le taux général de fécondité est le nombre de naissances vivantes pour 1,000 femmes âgées de 15 à 49 ans.

The *general marital fertility rate* is the number of live births to married women per 1,000 married women aged 15-49.

The age-specific fertility rate is the number of live births per 1,000 women in a specific age interval. Five-year age groups are usually used (15-19, ..., 45-49).

The age-specific marital fertility rate is the number of live births per 1,000 married women in a specific age interval.

The total fertility rate is the average number of children a woman can expect to have in her lifetime, based on the age-specific fertility rates of a given year. It is equal to the sum of the age-specific fertility rates (ages 15 to 49).

Death rates

The age-specific death rate is the number of deaths per 1,000 population in a specific age interval.

An age-standardized death rate is a weighted average of the age-specific death rates, using as weights the age distribution of a standard population.

Life expectancy is a statistic included in life tables. It is the average number of remaining years of life, at birth or other ages, based on a set of age-specific death rates at a given year.

The infant mortality rate is the number of infant deaths per 1,000 live births. The same denominator is used for neonatal and post-neonatal mortality rates and for stillbirth rates.

The perinatal mortality rate is the number of late fetal deaths (28+ weeks gestation) plus early neonatal deaths (< 7 days) per 1,000 total births.

The maternal death rate is the number of maternal deaths per 10,000 live births.

DATA QUALITY

Coverage

Due to legal reporting requirements, registration of births and deaths is considered to be virtually complete. However, records received after a "cut-off date" and births and deaths occurring to Canadians in countries other than Canada or the United States are missing. Furthermore, births and deaths of non-permanent residents in Canada may be excluded if the declared usual place of residence of the mother or of the deceased is not Canada. These result in some undercoverage.

Le taux général de fécondité légitime est le nombre de naissances vivantes pour 1,000 femmes mariées de 15 à 49 ans.

Taux de fécondité par âge est le nombre de naissances vivantes pour 1,000 femmes dans un intervalle d'âge donné. On utilise habituellement des groupes d'âge de cinq ans (15-19, ..., 45-49).

Le taux de fécondité légitime par âge est le nombre de naissances vivantes pour 1,000 femmes mariées dans un intervalle d'âge donné.

L'indice synthétique de fécondité est le nombre moyen d'enfants qu'une femme aurait au cours de sa vie selon les conditions de fécondité d'une année donnée; somme des taux de fécondité par âge (15 à 49 ans).

Taux de mortalité

Le taux de mortalité par âge est le nombre de décès pour 1,000 personnes dans un intervalle d'âge donné.

Le taux de mortalité normalisé selon l' âge est la moyenne des taux de mortalité par âge pondérée par la distribution par âge d'une population standard.

L'espérance de vie est une statistique figurant dans les tables de mortalité. C'est la vie moyenne calculée à la naissance ou aux différents anniversaires, selon les conditions de mortalité d'une année donnée

Le taux de mortalité infantile est le nombre de décès infantiles pour 1,000 naissances vivantes. Le même dénominateur sert pour les taux de mortalité néonatale et post-néonatale ainsi que pour le taux de mortinaissance.

Le taux de mortalité périnatale est le nombre de décès foetals tardifs (28+ semaines de gestation) et décès néonatals précoces (< 7 jours) pour 1,000 naissances totales.

Le taux de mortalité matemelle est le nombre de décès maternels pour 10,000 naissances vivantes.

QUALITÉ DES DONNÉES

Couverture

Comme l'enregistrement des naissances et des décès est exigé par la loi, les données sur les naissances et les décès sont considérées comme presque complètes. Cependant, les enregistrements reçus après la date limite et les naissances et les décès de Canadiens se produisant dans des pays autres que le Canada et les États-Unis sont manquantes. De plus, des naissances et des décès de résidents non permanents au Canada ont pu être exclus si le lieu habituel de résidence déclaré de la mère ou du décédé n'est pas le Canada. Ceci résulte en un certain sous-enregistrement.

In 1991, an agreement was signed with the province of Newfoundland that allowed Statistics Canada to use data from the Physician Notification of Births (PNOB) file, obtained from the Newfoundland Department of Health, which are more complete, both in terms of registered births and collected variables, than those from the provincial Registrar. Before 1991, the Registrar provided only counts of births that usually had to be adjusted for under-enumeration.

Quality Indicators

Quality assessment studies(3,4) conducted on a sample of 1981 records for ten provinces indicated that error rates for most variables were quite low. Concerns at that time related to the residence of the deceased at the local area level and to the underlying cause of death, two variables that are not included in this publication.

Completeness

The reponse rate of reporting of core statistical data items varies with the item, the reporting province or territory and the year. The response rate is defined here as the percentage of records for which the value of the data item is neither unknown nor not stated. In most provinces and territories, it was close to 100% when the item was reported at all. Analyses using a variable with a relatively low reponse rate may be biaised by differences between the characteristics of individuals for whom the information is not provided and individuals with valid responses.

Timeliness

Data are usually available towards the end of the year following the data year and the tabulations shortly thereafter.

En 1991, un accord était signé avec la province de Terre-Neuve permettant à Statistique Canada d'utiliser les données provenant du fichier médical de notification des naissances (PNOB) du Ministère de la santé de Terre-Neuve, qui sont plus complètes, autant quant au nombre de naissances enregistrées qu'à celui des variables recueillies, que celles du Registraire de la province. Avant 1991, le Registraire ne fournissait que les nombres totaux de naissances qui devaient, le plus souvent, être corrigés d'un certain sousenregistrement.

Indicateurs de qualité

Des études d'évaluation de la qualité(3,4), effectuée sur un échantillon d'enregistrements de 1981 pour les dix provinces, avait indiqué des taux d'erreur assez bas pour la plupart des variables. On était préoccupé à ce moment-là du lieu de résidence du défunt à l'échelle infra-provinciale et de la cause sous-jacente du décès, deux variables qui ne font pas partie de cette publication.

Intégralité

Le taux de réponse des principaux éléments d'information varie selon l'élément, la province ou le territoire déclarant et l'année. Le taux de réponse est défini ici comme le pourcentage d'enregistrements où la valeur d'un élément donné n'est ni inconnue ni laissée en blanc. Dans la plupart des provinces et territoires, le taux de réponse était près de 100% quand la variable était rapportée. Les analyses portant sur une variable dont le taux de réponse est relativement faible peuvent être biaisées par des différences dans les caractéristiques des répondants et des non-répondants.

Actualité

Les données sont habituellement disponibles vers la fin de l'année suivant l'année de données, et les totalisations peu de temps après.

⁽¹⁾ Including unknown gestation age, since only births of 500 g or 20 wks gestation are reportable as stillbirths in Canada.

Including unknown gestation age, since only births of 500 g or 20 wks gestation are reportable as stillbirths in the comprend durfee de gestation inconnue, puisque seules les naissances de 500 g et plus ou d'au moins 20 semaines de gestation sont déclarées comme mort-nés au Canada.
 Excluding unknown gestational age, for comparability with most previous publications of this Division. About half of all stillbirths with known gestational age were of 28 + weeks gestation.
 Excluant durée de gestation inconnue, pour faciliter la comparaison avec la plupart des publications de cette Division; environ la moitié des mortinaissances dont la durée de gestation était connue avait une durée de gestation d'au moins 28 semaines.
